Outline of the thesis

- Attempts to find new hyper-Kähler varieties.

Outline of the thesis

- Attempts to find new hyper-Kähler varieties.
 - Strategy: Naïvely perturb monomial equations of Stanley–Reisner ideals of known triangulations of \mathbb{CP}^2 . **Did not work.**

Outline of the thesis

- Attempts to find new hyper-Kähler varieties.
 - Strategy: Naïvely perturb monomial equations of Stanley–Reisner ideals of known triangulations of \mathbb{CP}^2 . **Did not work.**
- The topology of smoothings of $C(dP_6)$.

Outline of the thesis

- Attempts to find new hyper-Kähler varieties.
 - Strategy: Naïvely perturb monomial equations of Stanley–Reisner ideals of known triangulations of \mathbb{CP}^2 . **Did not work.**
- The topology of smoothings of $C(dP_6)$.
 - Identify the smoothings as hyperplane complements, and use exact sequences from algebraic topology.

Outline of the thesis

 - Found by smoothing a certain Stanley–Reisner sphere.

Outline of the thesis

- Attempts to find new hyper-Kähler varieties.
 - Strategy: Naïvely perturb monomial equations of Stanley–Reisner ideals of known triangulations of \mathbb{CP}^2 . **Did not work.**
- The topology of smoothings of $C(dP_6)$.
 - Identify the smoothings as hyperplane complements, and use exact sequences from algebraic topology.
- New Calabi–Yau varieties and potential mirror partners.
 - Found by smoothing a certain Stanley–Reisner sphere.

I will now focus on the last point — the construction of the new Calabi–Yau’s.

Stanley–Reisner schemes

- Given a simplicial complex \mathcal{F} , we get a Stanley–Reisner scheme $\mathbb{P}(\mathcal{F})$.

Stanley–Reisner schemes

- Given a simplicial complex \mathcal{F} , we get a Stanley–Reisner scheme $\mathbb{P}(\mathcal{F})$.
- Is a union of projective spaces $\mathbb{P}^{\dim f}$, indexed by faces f of \mathcal{F} .

Stanley–Reisner schemes

- Given a simplicial complex \mathcal{F} , we get a Stanley–Reisner scheme $\mathbb{P}(\mathcal{F})$.
- Is a union of projective spaces $\mathbb{P}^{\dim f}$, indexed by faces f of \mathcal{F} .

Example

From a simplicial complex to a union of \mathbb{P}^1 's.

The ideal is generated by $x_i x_{i+2} = x_i x_{i+3} = 0$ ($i = 0, \dots, 5$).

Stanley–Reisner schemes

- **Join** $X * Y$ of two projective subschemes X and Y : The (closure of the) union of all lines between X and Y .

Stanley–Reisner schemes

- **Join** $X * Y$ of two projective subschemes X and Y : The (closure of the) union of all lines between X and Y .
- **Join** of two Stanley–Reisner schemes $\mathbb{P}(\mathcal{F})$ and $\mathbb{P}(\mathcal{G})$ is $\mathbb{P}(\mathcal{F} * \mathcal{G})$, where the faces of $\mathcal{F} * \mathcal{G}$ are $f \sqcup g$ for $f \in \mathcal{F}$, $g \in \mathcal{G}$.

Stanley–Reisner schemes

- **Join** $X * Y$ of two projective subschemes X and Y : The (closure of the) union of all lines between X and Y .
- **Join** of two Stanley–Reisner schemes $\mathbb{P}(\mathcal{F})$ and $\mathbb{P}(\mathcal{G})$ is $\mathbb{P}(\mathcal{F} * \mathcal{G})$, where the faces of $\mathcal{F} * \mathcal{G}$ are $f \sqcup g$ for $f \in \mathcal{F}$, $g \in \mathcal{G}$.

Smoothings of Stanley–Reisner schemes:

- Given a basis for $T^1(S_{\mathbb{P}(\mathcal{K})}/k, S_{\mathbb{P}(\mathcal{K})})_0$, we can try to find a smoothing of $X_0 = \mathbb{P}(\mathcal{K})$.

Stanley–Reisner schemes

- **Join** $X * Y$ of two projective subschemes X and Y : The (closure of the) union of all lines between X and Y .
- **Join** of two Stanley–Reisner schemes $\mathbb{P}(\mathcal{F})$ and $\mathbb{P}(\mathcal{G})$ is $\mathbb{P}(\mathcal{F} * \mathcal{G})$, where the faces of $\mathcal{F} * \mathcal{G}$ are $f \sqcup g$ for $f \in \mathcal{F}$, $g \in \mathcal{G}$.

Smoothings of Stanley–Reisner schemes:

- Given a basis for $T^1(S_{\mathbb{P}(\mathcal{K})}/k, S_{\mathbb{P}(\mathcal{K})})_0$, we can try to find a smoothing of $X_0 = \mathbb{P}(\mathcal{K})$.
- A smoothing X of X_0 will have many of the same properties:
 - The same Hilbert polynomial.
 - By semicontinuity, if X_0 is a sphere, X will be Calabi–Yau.

Calabi–Yau varieties

Definition

A **Calabi–Yau variety** is an irreducible, smooth, projective scheme X/\mathbb{C} of dimension 3 satisfying:

- $H^0(X, \mathcal{O}_X) = H^3(X, \mathcal{O}_X) = \mathbb{C}$ and $H^1(X, \mathcal{O}_X) = H^2(X, \mathcal{O}_X) = 0$.
- The canonical sheaf is trivial: $\omega_X \simeq \mathcal{O}_X$.

Calabi–Yau varieties

Definition

A **Calabi–Yau variety** is an irreducible, smooth, projective scheme X/\mathbb{C} of dimension 3 satisfying:

- $H^0(X, \mathcal{O}_X) = H^3(X, \mathcal{O}_X) = \mathbb{C}$ and $H^1(X, \mathcal{O}_X) = H^2(X, \mathcal{O}_X) = 0$.
- The canonical sheaf is trivial: $\omega_X \simeq \mathcal{O}_X$.

- Easiest invariants are the **Euler characteristic** and the **Hodge numbers**, $h^{ij} = h^j(X, \Omega_{X/\mathbb{C}}^i)$.

$$\begin{array}{ccccccc} & & & h^{00} & & & \\ & & h^{01} & & h^{10} & & \\ & h^{02} & & h^{11} & & h^{20} & \\ h^{03} & & h^{12} & & h^{21} & & h^{30} \\ & h^{13} & & h^{22} & & h^{31} & \\ & & h^{23} & & h^{32} & & \\ & & & h^{33} & & & \end{array}$$

Calabi–Yau varieties

Hodge numbers heuristic

The quintic $X := V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Hodge numbers heuristic

The quintic $X := V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

The number h^{12} is the dimension of the “space of parameters” of X . The following heuristic will give us the correct Hodge number:

Hodge numbers heuristic

The quintic $X := V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

The number h^{12} is the dimension of the “space of parameters” of X . The following heuristic will give us the correct Hodge number:

- The space of degree 5 polynomials $H^0(\mathbb{P}^4, \mathcal{O}_{\mathbb{P}^4}(5))$ in \mathbb{P}^4 is $\binom{4+5}{4} = \binom{9}{4} = 126$ -dimensional. Hence $\mathbb{P}(H^0(\mathbb{P}^4, \mathcal{O}_{\mathbb{P}^4}(5))) = \mathbb{P}^{125}$.

Hodge numbers heuristic

The quintic $X := V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

The number h^{12} is the dimension of the “space of parameters” of X . The following heuristic will give us the correct Hodge number:

- The space of degree 5 polynomials $H^0(\mathbb{P}^4, \mathcal{O}_{\mathbb{P}^4}(5))$ in \mathbb{P}^4 is $\binom{4+5}{4} = \binom{9}{4} = 126$ -dimensional. Hence $\mathbb{P}(H^0(\mathbb{P}^4, \mathcal{O}_{\mathbb{P}^4}(5))) = \mathbb{P}^{125}$.
- This is not unique, but we can act by $\mathrm{PGL}(5)$ to identify isomorphic quintics. We have $\dim \mathrm{PGL}(5) = 25 - 1 = 24$.

Hodge numbers heuristic

The quintic $X := V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

The number h^{12} is the dimension of the “space of parameters” of X . The following heuristic will give us the correct Hodge number:

- The space of degree 5 polynomials $H^0(\mathbb{P}^4, \mathcal{O}_{\mathbb{P}^4}(5))$ in \mathbb{P}^4 is $\binom{4+5}{4} = \binom{9}{4} = 126$ -dimensional. Hence $\mathbb{P}(H^0(\mathbb{P}^4, \mathcal{O}_{\mathbb{P}^4}(5))) = \mathbb{P}^{125}$.
- This is not unique, but we can act by $\mathrm{PGL}(5)$ to identify isomorphic quintics. We have $\dim \mathrm{PGL}(5) = 25 - 1 = 24$.
- In total: $125 - 24 = 101$, which is $h^{12}(X)$. ■

Mirror symmetry

- Calabi–Yau threefolds seem to “always” have “mirror partners”.

$$\begin{array}{ccccccc}
 & & & X & & & \\
 \hline
 & & & 1 & & & \\
 & & 0 & & 0 & & \\
 & 0 & & 1 & & 0 & \\
 1 & & 101 & & 101 & & 1 \\
 & 0 & & 1 & & 0 & \\
 & & 0 & & 0 & & \\
 & & & 1 & & &
 \end{array}$$

Mirror symmetry

- Calabi–Yau threefolds seem to “always” have “mirror partners”.
- Mirror partner X° to X has “mirrored Hodge diamond”.

The mirror construction Ansatz

Sometimes the following method produces a mirror manifold of a Calabi–Yau X :

- 1 Suppose X has a natural degeneration X_0 with a finite automorphism group G .
- 2 Find a family $\pi: \mathcal{X} \rightarrow S$ on which G acts, and such that the general fiber X_t has only isolated singularities.
- 3 There might be a finite subgroup H of the big torus acting. A mirror candidate is then a crepant resolution of X_t/H .

The mirror construction Ansatz

Sometimes the following method produces a mirror manifold of a Calabi–Yau X :

- 1 The general quintic degenerates to the singular scheme $V(x_0x_1x_2x_3x_4)$.
- 2 Find a family $\pi: \mathcal{X} \rightarrow S$ on which G acts, and such that the general fiber X_t has only isolated singularities.
- 3 There might be a finite subgroup H of the big torus acting. A mirror candidate is then a crepant resolution of X_t/H .

The mirror construction Ansatz

Sometimes the following method produces a mirror manifold of a Calabi–Yau X :

- 1 The general quintic degenerates to the singular scheme $V(x_0x_1x_2x_3x_4)$.
- 2 The family defined by $f_t = x_0x_1x_2x_3x_4 + t \sum_{i=1}^5 x_i^5$ is S_5 -invariant.
- 3 There might be a finite subgroup H of the big torus acting. A mirror candidate is then a crepant resolution of X_t/H .

The mirror construction Ansatz

Sometimes the following method produces a mirror manifold of a Calabi–Yau X :

- 1 The general quintic degenerates to the singular scheme $V(x_0x_1x_2x_3x_4)$.
- 2 The family defined by $f_t = x_0x_1x_2x_3x_4 + t \sum_{i=1}^5 x_i^5$ is S_5 -invariant.
- 3 There is an action of $H := (\mathbb{Z}/5)^5/(\mathbb{Z}/5)$ on X_t .
Crepan resolutions of X_t/H exists, and are mirrors.

The mirror construction Ansatz

Sometimes the following method produces a mirror manifold of a Calabi–Yau X :

- 1 The general quintic degenerates to the singular scheme $V(x_0x_1x_2x_3x_4)$.
- 2 The family defined by $f_t = x_0x_1x_2x_3x_4 + t \sum_{i=1}^5 x_i^5$ is S_5 -invariant.
- 3 There is an action of $H := (\mathbb{Z}/5)^5/(\mathbb{Z}/5)$ on X_t .
Crepant resolutions of X_t/H exists, and are mirrors.

We can use **Roan's formula** to compute the Euler characteristic:

Theorem (Roan's formula)

$$\chi(\widetilde{X_t/H}) = \frac{1}{|H|} \sum_{g,h \in H} \chi(\tilde{X}_t^g \cap \tilde{X}_t^h)$$

The cone over dP_6

- Let $dP_6 \subset \mathbb{P}^6$ be an anticanonically embedded del Pezzo surface of degree 6. Let $C(dP_6)$ be its affine cone in \mathbb{A}^7 .
- The equations are

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y & x_3 \\ x_5 & x_6 & y \end{vmatrix} \leq 1.$$

The origin is an isolated singularity.

The cone over dP_6

- Let $dP_6 \subset \mathbb{P}^6$ be an anticanonically embedded del Pezzo surface of degree 6. Let $C(dP_6)$ be its affine cone in \mathbb{A}^7 .
- The equations are
- There are two smoothing components.
- They come from perturbations of different forms of writing the equation.

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y & x_3 \\ x_5 & x_6 & y \end{vmatrix} \leq 1.$$

The origin is an isolated singularity.

The cone over dP_6

- Let $dP_6 \subset \mathbb{P}^6$ be an anticanonically embedded del Pezzo surface of degree 6. Let $C(dP_6)$ be its affine cone in \mathbb{A}^7 .
- The equations are

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y & x_3 \\ x_5 & x_6 & y \end{vmatrix} \leq 1.$$

The origin is an isolated singularity.

- There are two smoothing components.
- They come from perturbations of different forms of writing the equation.
- Can also write the equations as:

$$\leq 1$$

The two smoothing components of dP_6

We can identify one component with $\mathbb{P}(\mathcal{T}_{\mathbb{P}^2}) \setminus H$, where $\mathcal{T}_{\mathbb{P}^2}$ is the tangent bundle of \mathbb{P}^2 .

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y + t_1 & x_3 \\ x_5 & x_6 & y + t_2 \end{vmatrix} \leq 1$$

The two smoothing components of dP_6

We can identify one component with $\mathbb{P}(\mathcal{T}_{\mathbb{P}^2}) \setminus H$, where $\mathcal{T}_{\mathbb{P}^2}$ is the tangent bundle of \mathbb{P}^2 .

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y + t_1 & x_3 \\ x_5 & x_6 & y + t_2 \end{vmatrix} \leq 1$$

The second component can be identified with $(\mathbb{P}^1 \times \mathbb{P}^1 \times \mathbb{P}^1) \setminus H$, where H is a $(1, 1, 1)$ -divisor.

Construction of a new Calabi–Yau: X_1

Construction of a new Calabi–Yau: X_1

- Let E be a vector space with basis e_1, e_2, e_3 . Consider

$$\mathbb{P}^{17} = \mathbb{P}((E \otimes E) \oplus (E \otimes E)).$$

The elements are pairs of 3×3 matrices, equal up to scalar multiplication.

Construction of a new Calabi–Yau: X_1

- Let E be a vector space with basis e_1, e_2, e_3 . Consider

$$\mathbb{P}^{17} = \mathbb{P}((E \otimes E) \oplus (E \otimes E)).$$

The elements are pairs of 3×3 matrices, equal up to scalar multiplication.

- Consider the set M of pairs of matrices (A, B) with rank $1 + 1$.

Construction of a new Calabi–Yau: X_1

- Let E be a vector space with basis e_1, e_2, e_3 . Consider

$$\mathbb{P}^{17} = \mathbb{P}((E \otimes E) \oplus (E \otimes E)).$$

The elements are pairs of 3×3 matrices, equal up to scalar multiplication.

- Consider the set M of pairs of matrices (A, B) with rank $1 + 1$.
- Intersect M with a generic $\mathbb{P}^{11} \subset \mathbb{P}^{17}$. Let $X_1 := M \cap \mathbb{P}^{11}$.

Construction of a new Calabi–Yau: X_1

- Let E be a vector space with basis e_1, e_2, e_3 . Consider

$$\mathbb{P}^{17} = \mathbb{P}((E \otimes E) \oplus (E \otimes E)).$$

The elements are pairs of 3×3 matrices, equal up to scalar multiplication.

- Consider the set M of pairs of matrices (A, B) with $\text{rank } 1 + 1$.
- Intersect M with a generic $\mathbb{P}^{11} \subset \mathbb{P}^{17}$. Let $X_1 := M \cap \mathbb{P}^{11}$.

Theorem

X_1 is a smooth Calabi–Yau with Euler characteristic -72 .

Construction of a new Calabi–Yau: X_2

- Let F be a vector space with basis f_1, f_2 . Consider

$$\mathbb{P}^{15} = \mathbb{P}((F \otimes F \otimes F) \oplus (F \otimes F \otimes F)).$$

The elements are pairs of $2 \times 2 \times 2$ -tensors, equal up to scalar multiplication.

- Consider the set N of pairs of tensors (A, B) with rank $1 + 1$.
- Intersect N with a generic $\mathbb{P}^{11} \subset \mathbb{P}^{15}$. Let $X_2 := N \cap \mathbb{P}^{11}$.

Theorem

X_2 is a smooth Calabi–Yau with Euler characteristic -48 .

Construction of a new Calabi–Yau: X_3

- Let E and F be as before. Consider

$$\mathbb{P}^{16} = \mathbb{P}((E \otimes E) \oplus (F \otimes F \otimes F)).$$

- Consider the set W of pairs of tensors (A, B) with rank $1 + 1$.
- Intersect W with a generic $\mathbb{P}^{11} \subset \mathbb{P}^{16}$. Let $X_3 := W \cap \mathbb{P}^{11}$.

Theorem

X_3 is a smooth Calabi–Yau with Euler characteristic -60 .

Hodge number heuristics

Conjecture

X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

“Reason”.

- 1 We know the Euler characteristic, so it is enough to find h^{12} .

Hodge number heuristics

Conjecture

X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

“Reason”.

- 1 We know the Euler characteristic, so it is enough to find h^{12} .
- 2 The Grassmannian of \mathbb{P}^{11} 's in \mathbb{P}^{17} is 72-dimensional.

Hodge number heuristics

Conjecture

X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

“Reason”.

- 1 We know the Euler characteristic, so it is enough to find h^{12} .
- 2 The Grassmannian of \mathbb{P}^{11} 's in \mathbb{P}^{17} is 72-dimensional.
- 3 We can act with automorphisms from $\prod_{i=1}^4 \mathrm{GL}(E)$.

Hodge number heuristics

Conjecture

X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

“Reason”.

- 1 We know the Euler characteristic, so it is enough to find h^{12} .
- 2 The Grassmannian of \mathbb{P}^{11} 's in \mathbb{P}^{17} is 72-dimensional.
- 3 We can act with automorphisms from $\prod_{i=1}^4 \mathrm{GL}(E)$.
- 4 The subgroup $\{t_1 t_2 = t_3 t_4\} \subset (\mathbb{C}^*)^4 \subset \prod_{i=1}^4 \mathrm{GL}(E)$ acts trivially.

Hodge number heuristics

Conjecture

X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

“Reason”.

- 1 We know the Euler characteristic, so it is enough to find h^{12} .
- 2 The Grassmannian of \mathbb{P}^{11} 's in \mathbb{P}^{17} is 72-dimensional.
- 3 We can act with automorphisms from $\prod_{i=1}^4 \mathrm{GL}(E)$.
- 4 The subgroup $\{t_1 t_2 = t_3 t_4\} \subset (\mathbb{C}^*)^4 \subset \prod_{i=1}^4 \mathrm{GL}(E)$ acts trivially.
- 5 Hence $h^{12} = 72 - \left(\dim \prod_{i=1}^4 \mathrm{GL}(E) - 3 \right) = 72 - 33 = 39$. ■

Mirror candidate for X_1

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H := \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.

Mirror candidate for X_1

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H := \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.
- Another $\mathbb{Z}/3$ -action $e_i \mapsto e_{i+1}$.

Mirror candidate for X_1

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H := \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.
- Another $\mathbb{Z}/3$ -action $e_i \mapsto e_{i+1}$.
- Extend to actions on $\mathbb{P}((E \otimes E) \oplus (E \otimes E)) = \mathbb{P}^{17}$.

Mirror candidate for X_1

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H := \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.
- Another $\mathbb{Z}/3$ -action $e_i \mapsto e_{i+1}$.
- Extend to actions on $\mathbb{P}((E \otimes E) \oplus (E \otimes E)) = \mathbb{P}^{17}$.
- Choose invariant \mathbb{P}^{11} : Defined by

$$f_{ij}^\alpha = e_{ij}^\alpha + t_{-i-j}^\alpha e_{-i-j, -i-j}^{\alpha+1}$$

for $i, j \in \mathbb{Z}/3 \times \mathbb{Z}/3$ ($i \neq j$) and $\alpha = 0, 1$.

Mirror candidate for X_1

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H := \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.
- Another $\mathbb{Z}/3$ -action $e_i \mapsto e_{i+1}$.
- Extend to actions on $\mathbb{P}((E \otimes E) \oplus (E \otimes E)) = \mathbb{P}^{17}$.
- Choose invariant \mathbb{P}^{11} : Defined by

$$f_{ij}^\alpha = e_{ij}^\alpha + t_{-i-j}^\alpha e_{-i-j, -i-j}^{\alpha+1}$$

for $i, j \in \mathbb{Z}/3 \times \mathbb{Z}/3$ ($i \neq j$) and $\alpha = 0, 1$.

- The resulting $X_{H_t} := \mathbb{P}^{11} \cap M$ is singular with 48 isolated double point singularities.

Mirror candidate for X_1

- We divide out by the H -action and resolve: $X_1^\circ := \widetilde{X_{H_t}}/H$.

Mirror candidate for X_1

- We divide out by the H -action and resolve: $X_1^\circ := \widetilde{X_{H_t}}/H$.
- Roan's formula gives:

$$\chi(X_1^\circ) = \frac{1}{3} (24 + 8 \cdot 24) = 72.$$

Based on this calculation and the mirror heuristic, we conjecture:

Conjecture

X_1° is a mirror of X_1 .

Mirror candidate for X_1

- We divide out by the H -action and resolve: $X_1^\circ := \widetilde{X_{H_t}}/H$.
- Roan's formula gives:

$$\chi(X_1^\circ) = \frac{1}{3} (24 + 8 \cdot 24) = 72.$$

Based on this calculation and the mirror heuristic, we conjecture:

Conjecture

X_1° is a mirror of X_1 .

Remark

A very similar construction gives a mirror candidate for X_2 .
