Outline of the thesis

■ Attempts to find new hyper-Kähler varieties.

- Attempts to find new hyper-Kähler varieties.
 - Strategy: Naïvely perturb monomial equations of Stanley–Reisner ideals of known triangulations of CP². Did not work.

- Attempts to find new hyper-Kähler varieties.
 - Strategy: Naïvely perturb monomial equations of Stanley–Reisner ideals of known triangulations of CP². Did not work.
- The topology of smoothings of $C(dP_6)$.

- Attempts to find new hyper-Kähler varieties.
 - Strategy: Naïvely perturb monomial equations of Stanley–Reisner ideals of known triangulations of \mathbb{CP}^2 . Did not work.
- The topology of smoothings of $C(dP_6)$.
 - Identify the smoothings as hyperplane complements, and use exact sequences from algebraic topology.

- The topology of smoothings of $C(dP_6)$.
 - Identify the smoothings as hyperplane complements, and use exact sequences from algebraic topology.
- New Calabi-Yau varieties and potential mirror partners.
 - Found by smoothing a certain Stanley–Reisner sphere.

I will now focus on the last point - the construction of the new Calabi-Yau's.

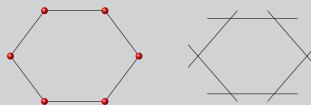

■ Given a simplicial complex \mathcal{F} , we get a Stanley–Reisner scheme $\mathbb{P}(\mathcal{F})$.

- Given a simplicial complex \mathcal{F} , we get a Stanley–Reisner scheme $\mathbb{P}(\mathcal{F})$.
- Is a union of projective spaces $\mathbb{P}^{\dim f}$, where f is a face of \mathcal{F} .

- Given a simplicial complex \mathcal{F} , we get a Stanley–Reisner scheme $\mathbb{P}(\mathcal{F})$.
- Is a union of projective spaces $\mathbb{P}^{\dim f}$, where f is a face of \mathcal{F} .

Example

From a simplicial complex to a union of \mathbb{P}^1 's.

The ideal is generated by $x_i x_{i+2} = x_i x_{i+3} = 0$ (i = 0, ..., 5).

■ Join of two subschemes *X* and *Y*: The (closure of) the union of all lines between *X* and *Y*.

- Join of two subschemes *X* and *Y*: The (closure of) the union of all lines between *X* and *Y*.
- Join of two Stanley–Reisner schemes $\mathbb{P}(\mathcal{F})$ and $\mathbb{P}(\mathcal{G})$ is $\mathbb{P}(\mathcal{F} * \mathcal{G})$, where the faces of $\mathcal{F} * \mathcal{G}$ are $f \sqcup g$ for $f \in \mathcal{F}$, $g \in \mathcal{G}$.

- Join of two subschemes X and Y: The (closure of) the union of all lines between X and Y.
- Join of two Stanley–Reisner schemes $\mathbb{P}(\mathcal{F})$ and $\mathbb{P}(\mathcal{G})$ is $\mathbb{P}(\mathcal{F}*\mathcal{G})$, where the faces of $\mathcal{F}*\mathcal{G}$ are $f \sqcup g$ for $f \in \mathcal{F}$, $g \in \mathcal{G}$.

Smoothings of Stanley–Reisner schemes:

■ Given a basis for $T^1(S_{\mathbb{P}(\mathcal{K})}/k, S_{\mathbb{P}(\mathcal{K})})_0$, we can try to find a smoothing of $X_0 = \mathbb{P}(\mathcal{K})$.

- Join of two subschemes X and Y: The (closure of) the union of all lines between X and Y.
- Join of two Stanley–Reisner schemes $\mathbb{P}(\mathcal{F})$ and $\mathbb{P}(\mathcal{G})$ is $\mathbb{P}(\mathcal{F}*\mathcal{G})$, where the faces of $\mathcal{F}*\mathcal{G}$ are $f \sqcup g$ for $f \in \mathcal{F}$, $g \in \mathcal{G}$.

Smoothings of Stanley-Reisner schemes:

- Given a basis for $T^1(S_{\mathbb{P}(\mathcal{K})}/k, S_{\mathbb{P}(\mathcal{K})})_0$, we can try to find a smoothing of $X_0 = \mathbb{P}(\mathcal{K})$.
- \blacksquare A smoothing X of X_0 will have many of the same properties:
 - The same Hilbert polynomial.
 - By semicontinuity, if X_0 is a sphere, X will be Calabi–Yau.

Definition

A Calabi–Yau variety is an irreducible, smooth, projective scheme X/\mathbb{C} of dimension 3 satisfying:

$$\blacksquare \ H^0(X,\mathscr{O}_X)=H^3(X,\mathscr{O}_X)=\mathbb{C} \ \text{and} \ H^1(X,\mathscr{O}_X)=H^2(X,\mathscr{O}_X)=0.$$

■ The canonical sheaf is trivial: $\omega_X \simeq \mathscr{O}_X$.

Definition

A Calabi–Yau variety is an irreducible, smooth, projective scheme X/\mathbb{C} of dimension 3 satisfying:

$$\blacksquare \ H^0(X,\mathscr{O}_X)=H^3(X,\mathscr{O}_X)=\mathbb{C} \ \text{and} \ H^1(X,\mathscr{O}_X)=H^2(X,\mathscr{O}_X)=0.$$

- The canonical sheaf is trivial: $\omega_X \simeq \mathscr{O}_X$.
- Easiest invariants are the Euler characteristic and the Hodge numbers, $h^{ij} = h^{i} \left(X, \Omega^{i}_{X/\mathbb{C}} \right)$.

Definition

A Calabi–Yau variety is an irreducible, smooth, projective scheme X/\mathbb{C} of dimension 3 satisfying:

$$\blacksquare \ H^0(X,\mathscr{O}_X)=H^3(X,\mathscr{O}_X)=\mathbb{C} \ \text{and} \ H^1(X,\mathscr{O}_X)=H^2(X,\mathscr{O}_X)=0.$$

- The canonical sheaf is trivial: $\omega_X \simeq \mathscr{O}_X$.
- Easiest invariants are the Euler characteristic and the Hodge numbers, $h^{ij} = h^j \left(X, \Omega^i_{X/\mathbb{C}} \right)$.
- We always have $\chi = 2(h^{11} h^{12})$.

The quintic $X = V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

The quintic $X = V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

The quintic $X = V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

The number h^{12} is the dimension of the "space of parameters" of X. The following heuristic will give us the correct Hodge number:

■ The space of degree 5 polynomials $H^0(\mathbb{P}^4, \mathscr{O}_{\mathbb{P}^4}(5))$ in \mathbb{P}^4 is $\binom{4+5}{4} = \binom{9}{4} = 126$ -dimensional. Hence $\mathbb{P}(H^0(\mathbb{P}^4, \mathscr{O}_{\mathbb{P}^4}(5))) = \mathbb{P}^{125}$.

The quintic $X = V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

- The space of degree 5 polynomials $H^0(\mathbb{P}^4, \mathscr{O}_{\mathbb{P}^4}(5))$ in \mathbb{P}^4 is $\binom{4+5}{4} = \binom{9}{4} = 126$ -dimensional. Hence $\mathbb{P}(H^0(\mathbb{P}^4, \mathscr{O}_{\mathbb{P}^4}(5))) = \mathbb{P}^{125}$.
- This is not unique, but we can act by PGL(5) to identify isomorphic quintics. We have $\dim PGL(5) = 25 1 = 24$.

The quintic $X = V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

- The space of degree 5 polynomials $H^0(\mathbb{P}^4, \mathscr{O}_{\mathbb{P}^4}(5))$ in \mathbb{P}^4 is $\binom{4+5}{4} = \binom{9}{4} = 126$ -dimensional. Hence $\mathbb{P}(H^0(\mathbb{P}^4, \mathscr{O}_{\mathbb{P}^4}(5))) = \mathbb{P}^{125}$.
- This is not unique, but we can act by PGL(5) to identify isomorphic quintics. We have $\dim PGL(5) = 25 1 = 24$.
- In total: 125 24 = 101, which is $h^{12}(X)$.

The quintic $X = V(f) \subset \mathbb{P}^4$ is the canonical example of a Calabi–Yau. It has Hodge numbers $h^{11} = 1$ and $h^{12} = 101$.

Heuristic.

- The space of degree 5 polynomials $H^0(\mathbb{P}^4, \mathscr{O}_{\mathbb{P}^4}(5))$ in \mathbb{P}^4 is $\binom{4+5}{4} = \binom{9}{4} = 126$ -dimensional. Hence $\mathbb{P}(H^0(\mathbb{P}^4, \mathscr{O}_{\mathbb{P}^4}(5))) = \mathbb{P}^{125}$.
- This is not unique, but we can act by PGL(5) to identify isomorphic quintics. We have $\dim PGL(5) = 25 1 = 24$.
- In total: 125 24 = 101, which is $h^{12}(X)$.

Mirror symmetry

■ Calabi–Yau threefolds seem to "always" have "mirror partners".

			Χ			
			1			
		0		0		
	0		1		0	
1		101		101		1
	0		1		0	
		0		0		
			1			

Mirror symmetry

- Calabi–Yau threefolds seem to "always" have "mirror partners".
- Mirror partner X° to X has "mirrored Hodge diamond".

X	\mathcal{X}°
1	1
0 0	0 0
0 1 0	0 101 0
1 101 101 1	1 1 1 1
0 1 0	0 101 0
0 0	0 0
1	1

Mirror symmetry

- Calabi–Yau threefolds seem to "always" have "mirror partners".
- Mirror partner X° to X has "mirrored Hodge diamond".
- Hence $\chi(X^{\circ}) = -\chi(X)$.

X						X°								
			1								1			
		0		0						0		0		
	0		1		0				0		101		0	
1		101		101		1		1		1		1		1
	0		1		0				0		101		0	
		0		0						0		0

- Suppose X has a natural degeneration X_0 with a finite automorphism group G.
- **2** Find a family $\pi \colon \mathscr{X} \to S$ on which G act, and such that the general fiber X_t has only isolated singularities.
- There might be a finite subgroup H of the big torus acting. A mirror candidate is then a crepant resolution of X_t/H .

- The general quintic degenerates to the singular scheme $V(x_0x_1x_2x_3x_4)$.
- **2** Find a family $\pi \colon \mathscr{X} \to S$ on which G act, and such that the general fiber X_t has only isolated singularities.
- There might be a finite subgroup H of the big torus acting. A mirror candidate is then a crepant resolution of X_t/H .

- The general quintic degenerates to the singular scheme $V(x_0x_1x_2x_3x_4)$.
- 2 The family defined by $f_t = x_0 x_1 x_2 x_3 x_4 + t \sum_{i=1}^5 x_i^5$ is S_5 -invariant.
- There might be a finite subgroup H of the big torus acting. A mirror candidate is then a crepant resolution of X_t/H .

- The general quintic degenerates to the singular scheme $V(x_0x_1x_2x_3x_4)$.
- 2 The family defined by $f_t = x_0 x_1 x_2 x_3 x_4 + t \sum_{i=1}^5 x_i^5$ is S_5 -invariant.
- There is an action of $H \triangleq (\mathbb{Z}/5)^5/(\mathbb{Z}/5)$ on X_t . Crepant resolutions of X_t/H exists, and are mirrors.

Sometimes the following method produces a mirror manifold of a Calabi–Yau *X*:

- The general quintic degenerates to the singular scheme $V(x_0x_1x_2x_3x_4)$.
- The family defined by $f_t = x_0 x_1 x_2 x_3 x_4 + t \sum_{i=1}^5 x_i^5$ is S_5 -invariant.
- There is an action of $H \triangleq (\mathbb{Z}/5)^5/(\mathbb{Z}/5)$ on X_t . Crepant resolutions of X_t/H exists, and are mirrors.

We can use Roan's formula to compute the Euler characteristic:

Theorem (Roan's formula)

$$\chi\left(\widetilde{X_t/H}\right) = \frac{1}{|H|} \sum_{g,h \in H} \chi\left(X_t^g \cap X_t^h\right)$$

The cone over dP₆

- Let dP₆ ⊂ P⁶ be an anticanonically embedded del Pezzo surface of degree 6. Let C(dP₆) be its affine cone in A⁷.
- The equations are

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y & x_3 \\ x_5 & x_6 & y \end{vmatrix} \le 1.$$

The origin is an isolated singularity.

The cone over dP₆

- Let dP₆ ⊂ P⁶ be an anticanonically embedded del Pezzo surface of degree 6. Let C(dP₆) be its affine cone in A⁷.
- The equations are

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y & x_3 \\ x_5 & x_6 & y \end{vmatrix} \le 1.$$

The origin is an isolated singularity.

- There are two smoothing components.
- They come from perturbations of different forms of writing the equation.

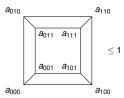

The cone over dP₆

- Let dP₆ ⊂ P⁶ be an anticanonically embedded del Pezzo surface of degree 6. Let C(dP₆) be its affine cone in A⁷.
- The equations are

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y & x_3 \\ x_5 & x_6 & y \end{vmatrix} \le 1.$$

The origin is an isolated singularity.

- There are two smoothing components.
- They come from perturbations of different forms of writing the equation.
- Can also write the equations as:

The two smoothing components of dP6

We can identify one component with $\mathbb{P}(\mathcal{T}_{\mathbb{P}^2}) \setminus H$, where $\mathcal{T}_{\mathbb{P}^2}$ is the tangent bundle of \mathbb{P}^2 .

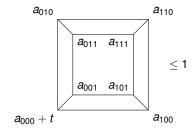

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y + t_1 & x_3 \\ x_5 & x_6 & y + t_2 \end{vmatrix} \le 1$$

The two smoothing components of dP₆

We can identify one component with $\mathbb{P}(\mathcal{T}_{\mathbb{P}^2}) \setminus H$, where $\mathcal{T}_{\mathbb{P}^2}$ is the tangent bundle of \mathbb{P}^2 .

$$\begin{vmatrix} y & x_1 & x_2 \\ x_4 & y + t_1 & x_3 \\ x_5 & x_6 & y + t_2 \end{vmatrix} \le 1$$

The second component can be identified with $(\mathbb{P}^1 \times \mathbb{P}^1 \times \mathbb{P}^1) \setminus H$, where H is a (1, 1, 1)-divisor.

■ Let E be a vector space with basis e_1 , e_2 , e_3 . Consider

$$\mathbb{P}^{17} = \mathbb{P}\Big((E \otimes E) \oplus (E \otimes E)\Big).$$

The elements are pairs of 3×3 matrices, equal up to scalar multiplication.

■ Let E be a vector space with basis e_1 , e_2 , e_3 . Consider

$$\mathbb{P}^{17} = \mathbb{P}\Big((E \otimes E) \oplus (E \otimes E)\Big).$$

The elements are pairs of 3×3 matrices, equal up to scalar multiplication.

■ Consider the set of pairs M of matrices (A, B) with rank 1 + 1.

■ Let E be a vector space with basis e_1 , e_2 , e_3 . Consider

$$\mathbb{P}^{17} = \mathbb{P}\Big((E \otimes E) \oplus (E \otimes E)\Big).$$

The elements are pairs of 3×3 matrices, equal up to scalar multiplication.

- Consider the set of pairs M of matrices (A, B) with rank 1 + 1.
- Intersect M with a generic $\mathbb{P}^{11} \subset \mathbb{P}^{17}$. Let $X_1 \stackrel{\Delta}{=} M \cap \mathbb{P}^{11}$.

■ Let E be a vector space with basis e_1 , e_2 , e_3 . Consider

$$\mathbb{P}^{17} = \mathbb{P}\Big((E \otimes E) \oplus (E \otimes E)\Big).$$

The elements are pairs of 3×3 matrices, equal up to scalar multiplication.

- Consider the set of pairs M of matrices (A, B) with rank 1 + 1.
- Intersect M with a generic $\mathbb{P}^{11} \subset \mathbb{P}^{17}$. Let $X_1 \stackrel{\Delta}{=} M \cap \mathbb{P}^{11}$.

Theorem

 X_1 is a smooth Calabi–Yau with Euler characteristic -72.

■ Let F be a vector space with basis f_1 , f_2 . Consider

$$\mathbb{P}^{15} = \mathbb{P}\Big((F \otimes F \otimes F) \oplus (F \otimes F \otimes F) \Big).$$

The elements are pairs of $2 \times 2 \times 2$ -tensors, equal up to scalar multiplication.

- Consider the set of pairs N of tensors (A, B) with rank 1 + 1.
- Intersect *N* with a generic $\mathbb{P}^{11} \subset \mathbb{P}^{15}$. Let $X_2 \stackrel{\triangle}{=} N \cap \mathbb{P}^{11}$.

Theorem

 X_2 is a smooth Calabi–Yau with Euler characteristic –48.

■ Let *E* and *F* be as before. Consider

$$\mathbb{P}^{16} = \mathbb{P}\Big((E \otimes E) \oplus (F \otimes F \otimes F)\Big).$$

- Consider the set of pairs W of tensors (A, B) with rank 1 + 1.
- Intersect W with a generic $\mathbb{P}^{11} \subset \mathbb{P}^{16}$. Let $X_3 \stackrel{\Delta}{=} W \cap \mathbb{P}^{11}$.

Theorem,

 X_3 is a smooth Calabi–Yau with Euler characteristic -60.

Conjecture

 X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

"Reason".

We know the Euler characteristic, so it is enough to find h^{12} .

Conjecture

 X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

- We know the Euler characteristic, so it is enough to find h^{12} .
- The Grassmannian of \mathbb{P}^{11} 's in \mathbb{P}^{17} is 72-dimensional.

Conjecture

 X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

- We know the Euler characteristic, so it is enough to find h^{12} .
- The Grassmannian of \mathbb{P}^{11} 's in \mathbb{P}^{17} is 72-dimensional.
- **3** We can act with automorphisms from $\prod_{i=1}^4 GL(E)$.

Conjecture

 X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

- We know the Euler characteristic, so it is enough to find h^{12} .
- The Grassmannian of \mathbb{P}^{11} 's in \mathbb{P}^{17} is 72-dimensional.
- **3** We can act with automorphisms from $\prod_{i=1}^4 GL(E)$.
- The subgroup $\{t_1 t_2 = t_3 t_4\} \subset (\mathbb{C}^*)^4 \subset \prod_{i=1}^4 \mathrm{GL}(E)$ acts trivially.

Conjecture

 X_1 has Hodge numbers $h^{11} = 3$ and $h^{12} = 39$.

- We know the Euler characteristic, so it is enough to find h^{12} .
- The Grassmannian of \mathbb{P}^{11} 's in \mathbb{P}^{17} is 72-dimensional.
- **3** We can act with automorphisms from $\prod_{i=1}^4 GL(E)$.
- The subgroup $\{t_1 t_2 = t_3 t_4\} \subset (\mathbb{C}^*)^4 \subset \prod_{i=1}^4 \mathrm{GL}(E)$ acts trivially.
- **5** Hence $h^{12} = 72 \left(\dim \prod_{i=1}^{4} GL(E) 3 \right) = 72 33 = 39.$

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

■ There is an $H = \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H = \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.
- Another $\mathbb{Z}/3$ -action $e_i \mapsto e_{i+1}$.

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H = \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.
- Another $\mathbb{Z}/3$ -action $e_i \mapsto e_{i+1}$.
- Extends to actions on $\mathbb{P}\Big((E \otimes E) \oplus (E \otimes E)\Big) = \mathbb{P}^{17}$.

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H = \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.
- Another $\mathbb{Z}/3$ -action $e_i \mapsto e_{i+1}$.
- Extends to actions on $\mathbb{P}\Big((E \otimes E) \oplus (E \otimes E)\Big) = \mathbb{P}^{17}$.
- Choose invariant \mathbb{P}^{11} : Defined by

$$f_{ij}^{\alpha}=e_{ij}^{\alpha}+t_{-i-j}^{\alpha}e_{-i-j,-i-j}^{\alpha+1}$$

for $i, j \in \mathbb{Z}/3 \times \mathbb{Z}/3$ $(i \neq j)$ and $\alpha = 0, 1$.

Using the mirror Ansatz, we propose mirror candidates for X_1 and X_2 .

- There is an $H = \mathbb{Z}/3$ -action on E defined by $e_i \mapsto \omega^i e_i$.
- Another $\mathbb{Z}/3$ -action $e_i \mapsto e_{i+1}$.
- Extends to actions on $\mathbb{P}\Big((E \otimes E) \oplus (E \otimes E)\Big) = \mathbb{P}^{17}$.
- Choose invariant \mathbb{P}^{11} : Defined by

$$f_{ij}^{\alpha}=e_{ij}^{\alpha}+t_{-i-j}^{\alpha}e_{-i-j,-i-j}^{\alpha+1}$$

for $i, j \in \mathbb{Z}/3 \times \mathbb{Z}/3$ $(i \neq j)$ and $\alpha = 0, 1$.

■ The resulting $X_{H_t} \stackrel{\triangle}{=} \mathbb{P}^{11} \cap M$ is singular with 48 isolated double point singularities.

■ We divide out by the *H*-action and resolve: $X_1^{\circ} \stackrel{\triangle}{=} \widetilde{X}_{H_i}/H$.

- We divide out by the H-action and resolve: $X_1^{\circ} \stackrel{\triangle}{=} \widetilde{X_{H_t}/H}$.
- Roan's formula gives:

$$\chi(X_1^\circ) = \frac{1}{3}(24 + 8 \cdot 24) = 72.$$

Based on this calculation and the mirror heuristic, we conjecture:

Conjecture

 X_1° is a mirror of X_1 .

- We divide out by the *H*-action and resolve: $X_1^{\circ} \stackrel{\triangle}{=} \widetilde{X_{H_1}/H}$.
- Roan's formula gives:

$$\chi(X_1^\circ) = \frac{1}{3}(24 + 8 \cdot 24) = 72.$$

Based on this calculation and the mirror heuristic, we conjecture:

Conjecture

 X_1° is a mirror of X_1 .

Remark

A very similar construction gives a mirror candidate for X_2 .
